

**HLA- B15, DISEASE  
ASSOCIATION, WHOLE  
BLOOD**  
(SSOP-Luminex)

Positive /  
Negative

**Noter;: All positive results must be confirmed by High Resolution Typing for HLA-B15**

**Comment**

Some genotypes of HLA- B15 are associated with severe skin conditions like Stevens-Johnson syndrome and Toxic epidermal necrolysis caused by Carbamazepine drug sensitivity specially in East Asians. A weak association has also been observed with Erythema nodosum. Erythema multiforme which shows a host specific immune response to various antigens, may be determined by genes linked to HLA-B15.
